

Continuous Security Monitoring for SaaS

Stay vigilant against SaaS breaches

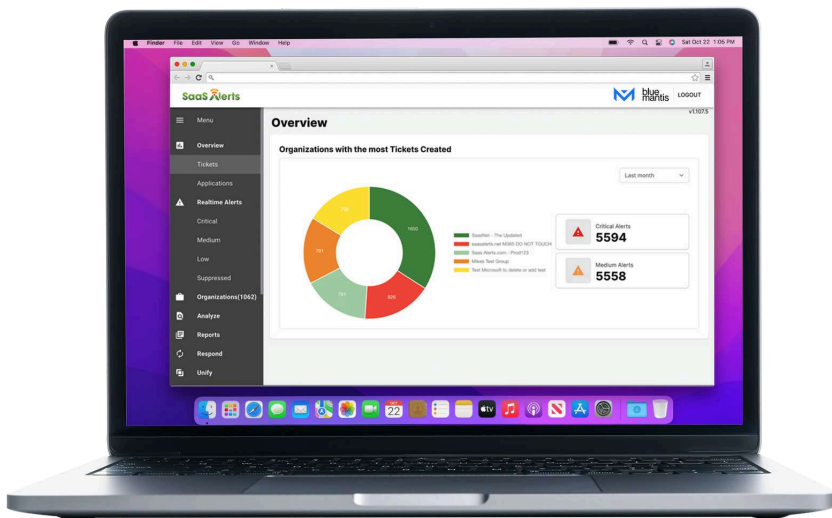

Today's businesses run on cloud-based software apps. That's why criminals target those software as a service (SaaS) apps to disrupt your business. Cybersecurity protocols such as conditional access, multifactor authentication, and more are effective only if your IT department has real-time visibility into all SaaS on your network.

Blue Mantis Continuous Security Monitoring for SaaS delivers true 24/7/365 automated detection and alerting against potential threats to your crucial business applications in the cloud.

Real-time SaaS security alerts

Gartner research shows 96% of businesses use multiple SaaS products, resulting in fragmented notification systems that can't quickly alert IT teams of potential threats. Blue Mantis partnered with industry leader SaaS Alerts to provide IT teams a unified and comprehensive SaaS security monitoring solution.

Blue Mantis Continuous Security Monitoring for SaaS integrates seamlessly with your existing IT processes and remote monitoring tools to automatically detect potential threats to Microsoft 365, Salesforce, Google Workspace, and hundreds of other SaaS solutions. Our solution instantly alerts you via email, text, and can automatically create a support ticket in your IT help desk system. You can also get forensic incident reports in an online dashboard.

Benefits

- Gain deep visibility into Microsoft 365, Salesforce, Google, and other SaaS solutions with real-time security reporting
- Monitor for threats from abnormal user behavior, excessive usage, and data loss/leakage
- Alert your IT security of suspicious activity 24/7/365 via automated emails, texts, and help desk tickets

Protect these and other critical apps by requesting a no-cost 30-day trial
